Acronyms and Abbreviations

Abbreviation / Term	Definition
%	Percentage
$\mu\text{g}/\text{m}^3$	Microgram per cubic meter
μm	Micro-metre. A measure of length equalling 1×10^{-6} of a metre
AA	Appropriate Assessment
ABP	An Bord Pleanála
ACA	Architectural Conservation Area
AEDT	Aviation Environmental Design Tool
ANCA	Aircraft Noise Competent Authority
ANPR	Automatic Number Plate Registration
ANQ	Annual Noise Quota
APU	Auxiliary Power Units
AQLV	Air Quality Limit Values
ATM	Air Traffic Movement
ASI	Archaeological Survey of Ireland
AQC	Air Quality Consultants
ACDM	Airport Collaborative Decision Making
BCT	Bat Conservation Trust
BNL	Basic Noise Level
BSI	British Standards Institute
CAR	Commission for Aviation Regulation
CAFE	Cleaner Air for Europe
CCD	Climb, Cruise and Descent
CCR	Climate Change Resilience
CEMP	Construction Environmental Management Plan
CFRAM	Catchment Flood Risk Assessment and Management
CGI	Computer Generated Imagery
CHD	Coronary Heart Disease
CH_4	Methane
CIEEM	Chartered Institute of Ecology and Environmental Management

TTA	Traffic and Transport Assessment
UK	United Kingdom
UV	Ultraviolet
VOC	Volatile Organic Compounds
WFD	Water Framework Directive
WHO	World Health Organisation
ZOI	Zone of Influence

Key Concepts and Terminology Used in the EIAR

(Proposed) Relevant Action

The proposed **Relevant Action** is to amend condition no. 3(d) and replace condition 5 of the **North Runway Planning Permission**, as described in Chapter 1 ('Introduction') and Chapter 2 ('Characteristics of the Project').

32 million passengers per annum (mppa) Cap (32 mppa Cap)

Cap on the permitted annual passenger capacity of the Terminals at Dublin Airport as a result condition no. 3 of the **Terminal 2 Planning Permission** and condition no. 2 of the **Terminal 1 Extension Planning Permission**. These conditions provide that the combined capacity of Terminal 1 and Terminal 2 together shall not exceed 32 million passengers per annum.

Permitted Scenario

This scenario assumes that the North Runway becomes operational but the airport is constrained by the restrictions on night-time use of the runway system at Dublin Airport, namely the restriction on the number of flights permitted between the hours of 23:00 and 07:00 which limits the number of flights to an average of 65 between these hours and the restriction of the use of North Runway at night (no use between 23:00 and 07:00) (i.e. conditions no. 3(d) and no. 5). These conditions do not currently apply to Dublin Airport but would come into force once the North Runway becomes operational. The **Permitted Scenario** also assumes that the current **32 mppa Cap** remains in place. Taken together, these characteristics mean that the **Permitted Scenario** represents the 'do nothing' case.

Proposed Scenario

This scenario represents the situation with the proposed **Relevant Action** in place. It assumes that the North Runway becomes operational but the airport is not constrained by the restrictions on night-time use of the runway system at Dublin Airport, namely the restriction on the number of flights permitted between the hours of 23:00 and 07:00 which limits the number of flights to an average of 65 between these hours (i.e. conditions no. 3(d) and no. 5). Instead the **Proposed Scenario** involves use of North Runway in the shoulder hours 06:00 to 07:00 and 23:00 to 00:00 and the introduction of a noise **Quota Count System** to replace the 65 average number of flights restriction. The **Proposed Scenario** also assumes that the current **32 mppa Cap** remains in place.

Current State of the Environment

The is the description of the current environmental conditions, as required by the EIA Directive 2011/92/EU (as amended by Directive 2014/52/EU). It is determined through desk-study and surveys undertaken between 2018 and 2021, as detailed in the technical chapters.

Future Receiving Environment

The **Future Receiving Environment** is the predicted state of the environment in three **Assessment Years** (2022, 2025 and 2035) and represents the likely evolution of the **Current State of the Environment** without implementation of the proposed **Relevant Action**. It is also used as the baseline environment against which the assessment of effects of the **Proposed Scenario** is undertaken. It is derived from the **Current State of the Environment**, adjusted to reflect likely changes occurring between now and the assessment years (insofar as it is possible to determine these).

This is in line with the draft Guidelines on the Information to be contained in Environmental Impact Assessment Reports (EPA, 2017) which explain that the predicted future baseline may be referred to as the likely future receiving environment.

Assessment of Effects

The effects of the proposed **Relevant Action** are identified by examining the predicted impacts of the **Permitted Scenario** on the **Future Receiving Environment** and comparing these with the predicted impacts of the **Proposed Scenario** on the same **Future Receiving Environment**.

Assessment Year(s)

The **Assessment Years** are the points in time at which the likely significant effects of the proposed **Relevant Action** are assessed. The reasons for selecting these years are given below.

- **2022**: the year when the North Runway is first expected to become operational.

- **2025:** the first year of highest use of the runway system in the **Proposed Scenario** (i.e. when 32 million passengers per annum throughput is first expected to be reached but not exceeded). This is also the first year of predicted maximum environmental effects in the **Proposed Scenario**.
- **2035:** this year has been included in the assessment in response to a request from Fingal County Council for Further Information which sought assessment of a longer-term scenario (i.e. 10 or 15 years post opening year scenario (2022).

North Runway Planning Permission

The **North Runway Planning Permission** is the planning application FCC Reg. Ref. No. F04A/1755; ABP Ref. No.: PL06F.217429 granted on 29th August 2007, and as amended by FCC F19A/0023, ABP Ref. No. ABP-305298-19 granted on the 18th March 2020 by An Bord Pleanála.

Terminal 1 Extension Planning Permission

The **Terminal 1 Extension Planning Permission** is the planning application FCC Reg. Ref. No. F06A/1843, ABP Ref. PL06F. 223469 granted on the 10th January 2008 by An Bord Pleanála.

Terminal 2 Planning Permission

The **Terminal 2 Planning Permission** is the planning application FCC Reg. Ref. No. F06A/1248, ABP Ref. PL06F.220670 granted on the 29th August 2007 by An Bord Pleanála.

Balanced Approach

The principle of the “balanced approach” to aircraft noise management was adopted by the International Civil Aviation Organisation (ICAO) Assembly in 2011. The **Balanced Approach** recognises the importance of achieving a careful balance between the interests of developing airport growth as well as managing noise levels; operating restrictions are only considered when all other elements of the **Balanced Approach** have been assessed.

Noise Abatement Objective

The Aircraft Noise (Dublin Airport) Regulation Act 2019 (Aircraft Noise Act) implements European Union Regulation 598/2014 on the establishment of rules and procedures with regard to the introduction of noise related operating restrictions at EU Airports within the **Balanced Approach**.

The Aircraft Noise Act also sets out a process of aircraft noise regulation whereby the Aircraft Noise Competent Authority (ANCA) shall ensure that the **Balanced Approach** is adopted where a noise problem at the airport has been identified and requires the identification of a **Noise Abatement Objective** (NAO) as appropriate.

Quota Count System

A Quota Count (QC) system is designed to limit the overall amount of noise produced by aircraft using an airport, based on an allowable Annual Noise Quota (ANQ) for a given time period. A QC value is assigned to each individual aircraft movement based on the certified noise level of that aircraft. Lower QC values are attributed to aircraft with lower noise levels, higher values to noisier aircraft. The QC accumulates for each Air Traffic Movement (ATM) against the allowable ANQ across the chosen time period. As such, the system allows a greater number of quieter aircraft movements within a given quota thereby encouraging the use of quieter aircraft at the airport.
